Annual Report 2014

The Danish Fracture Database

Preface

The annual report from the Danish Fracture Database (DFDB) 2014 is the second of its kind. It contains data based on almost 25.000 fracture related surgeries, of which approximately 20.000 are primary surgeries registered at www.dfdb.dk. The purpose of DFDB is web based quality monitoring of fracture related surgery and today these efforts are joined by 19 orthopaedic departments in Denmark. The effort to monitor quality of fracture related surgery in Denmark is unique and important: Unique because DFDB is the fracture register with the highest national coverage in the world and important given the high number of surgeries performed each year probably making fracture surgery/traumatology one of the busiest specialties within orthopaedic surgery. Previously it has not been possible to assess nationwide quality of all fracture related surgeries.

We wish to thank all the participating surgeons and departments taking part in this unique and important task. It is truly inspirational to realize the unity DFDB has brought into orthopaedic traumatology in Denmark. Also the continued support from The Danish Orthopaedic Society (DOS) and Danish Orthopaedic Trauma Society (DOT), and the possibility to present the annual report at the DOS Congress is much appreciated.

The annual report is structured differently compared to last year's report: Except for the first general section and the department specific section the report is based on report of data for each anatomic region, e.g. proximal humerus, distal radius, and proximal femur. This is an attempt to make it easier navigating the report and to make it more valuable to the readers. Please give us your feedback after studying the report – the process to improve is ongoing. The decision this year to print the annual report in English is primarily based on the interest in DFDB from our neighboring countries.

A basic principle surrounding DFDB is that surgeons reporting to the database should get feedback concerning the quality of treatment. This is delivered via e-mail and entails surgeon specific (only to be seen by the individual surgeon), department specific (the surgeon can only see data from his/her own department), and nationwide feedback on the rate of reoperations performed. The level of detail send by e-mail can be configured by the surgeon when logged in to DFDB. It is our hope that with time this feedback from DFDB can support surgeons in making decisions about best practice in fracture related surgery.

In Sweden a fracture register has been established too (www.frakturregistret.se). DFDB has engaged in co-operation with colleagues in Sweden and Norway to establish a core dataset of common parameters that will make it possible to join data and efforts across Scandinavia. Further, the efforts to become a national clinical quality monitoring database are ongoing. Finally, a platform to scan, trace and monitor orthopaedic implants has been introduced and taken in to use at one department. The scanned implants are linked together with the registrations in DFDB. It is a hope that the needed and important task of monitoring quality of specific implants and groups of implants can soon be undertaken in DFDB.

We hope to see more departments join DFDB in the future.

Hvidovre, d. 2. oktober, 2014

Anders Troelsen, Michael Brix, Kirill Gromov

About the Danish Fracture Database

Background and recent development

The aim of the Danish Fracture Database is to monitor the quality of surgical fracture treatment by assessing the rate of revision surgery both in general and for each fracture type specifically. This assessment results in a potential quality improvement through focus on specific fracture types where the quality of treatment is not considered high enough. Lastly, epidemiologic research in fracture surgery will contribute to identify surgical and fracture related prognostic factors for a good or poor outcome of surgery. The use of DFDB provides each participating department the possibility to monitor own data and thus the quality of their fracture treatment. The educational level of both the surgeon and the supervisor is registered and can therefore also be monitored. During the past year, there has been a marked escalation of data entry. The number of departments contributing to the database has increased from 9 to 19, giving an increase in the number of included patients from approximately 11.000 in 2013 to 25.000 in 2014.

Steering Committee

The idea behind DFDB and the registry's recent progress are attributed to Michael Brix and Anders Troelsen. Kirill Gromov contributed substantially to the registry's developmental phase. Michael, Anders and Kirill are today a part of the DFDB steering committee and are responsible for the registry's overall administration, quality monitoring, and research. In addition, each participating department is represented in the steering committee. Both DOT (Danish Orthopaedic Trauma Society) and DOS (Danish Orthopaedic Society) are also represented in the steering committee. A minimum of one annual meeting is held in order to correct inexpediciencies, increase the usability, and optimize the database through the members' feedback.

Secretariat and daily operations

Each participating department has a controller in daily charge of complete reporting. The daily operation is also supported by a secretariat, which was established last year at the Department of Orthopaedic Surgery, Hvidovre Hospital. The secretariat consists of an administrator, Alina Hansen, and a statistician, Thomas Kallelose.

Together the developers of DFDB and the secretariat has the responsibility and right to development and changes of the registry in cooperation with the provider Procordo Aps.

Summary and comments

In this annual report from DFDB we present a general overview of registered data as well as data for specific anatomical regions. The general overview covers basic demographics (age, gender and ASA score) for all primary surgeries as well as reoperations. Anatomical distribution of registered primary surgeries and reoperations as well as indications for reoperations are described. We describe the educational level of the primary surgeon and level of supervision for primary surgeries. Finally anatomical distribution for primary surgeries for all separate departments participating in the DFDB collaboration is described.

For definitions and specifications of the different parameters please see Appendix 1.

Demographics

84% of primary procedures were due to adult fractures and 16% due to pediatric fractures. Age distribution was biphasic, with first peak at age 0-20 and second peak at age 70-90. More males were surgically treated for fractures when age <50, while more female were surgically treated for fractures when age >50. 76% of patients with primary surgeries had an ASA score 1-2 while 79% of patients with reoperations had ASA score 1-2. 55% of all registered patients were female.

Anatomical distribution

Proximal femur (33%), distal radius (15%), and malleoli (12%) were the 3 most frequent operated regions for primary adult surgical procedures. Radius/ulna (58%), humerus (23%), and tibia (9%) were the 3 most frequently operated regions for primary paediatric surgical procedures.

Reoperations

Proximal femur (26%), malleoli (19%), and distal radi-

us (7%) were the 3 most frequently reoperated anatomical regions in adults. Radius/ulna (47%), humerus (24%), and tibia (16%) were the 3 most frequently reoperated anatomical regions in children. Pain and discomfort due to osteosynthesis material (35%), secondary fracture dislocation (16%), and infection (15%) were the 3 most frequent indications for adult reoperations. Secondary fracture dislocation (40%), suboptimal osteosynthesis (24%), and pain and discomfort due to osteosynthesis material (20%) were the 3 most frequent indications for paediatric reoperations.

Level of education

60% of all primary surgeries were performed by surgeons in training (intern - 5 year resident). Interns, 1 year resident, 2 year resident, and 3 year residents performed more procedures under supervision than without supervision, while 4-5 year residents, attending surgeons, and traumatologist performed more procedures without supervision than with supervision

Data limitations

There are some limitations to the data in this report. Essential limitations are:

- 1) Data completeness for treatment of primary fractures
- 2) Data completeness for reoperations

Initially, after full implementation of DFDB at the orthopaedic departments in Hvidovre and Odense, an evaluation of data validity and data completeness for treatment of primary fractures and reoperations was performed (Gromov 2013). Two plausible factors to limit data completeness were identified: 1) that the registry had only been implemented for few months, and 2) that both departments are large, with regularly 50-90 possible surgeons. The results of the study showed that the validity of data (the percentage of data that was correct when compared to the best external data source outside of DFDB) was 90-100% for all parameters, and most above 97%. The total degree of completeness for data entry of primary fracture treatment was 88% and for reoperations it was 77%. Thus, there was, at an early point in time after initiation of DFDB, a satisfactory degree of data validity and data completeness under the prevailing circumstances. Similar evaluations of data completeness should be performed continuously.

In addition to reoperations that are not registered at participating departments, data may lack for reoperations performed at non-participating departments. The extent of this phenomenon can be investigated by using data from the National Patient Registry (NPR). For this report data was not extracted from NPR with regards to knowing the "true" number of reoperations, and thus the rates of reoperations and survival curves are underestimated. Nonetheless these rates and curves are presented to illustrate the potential of data analysis using DFDB.

Fracture diagnosis in Danish National Patient Registry (NPR) have been investigated by Andersen et al. The overall validity of data was 86%. The NPR diagnosis code was correct in 94% of all cases and the

NPR anatomic region was correct in 99% of all cases. In 91% of all cases the operation code was correct and the anatomic region for the operation was correct in 99% of all cases.

NPR coding will be used in the future for continuous completeness monitoring of DFDB data.

Data was extracted from DFDB on August 11th 2014.

Participating departments

October 1, 2014, the following 19 departments took part in DFDB:

Aabenraa Hospital

Aalborg University Hospital

Aarhus University Hospital

Bispebjerg Hospital

Copenhagen University Hospital, Hvidovre

Farsø

Herlev Hospital

Hillerød, Nordsjællands Hospital

Holbæk Hospital

Horsens Hospital

Kolding Hospital

Køge Hospital

Nykøbing F. Hospital

Odense University Hospital

Rigshospitalet

Slagelse Hospital

Sydvestjysk Hospital Esbjerg

Vejle Hospital

Viborg Hospital

General overview of data

The graphs in this section covers general areas such as surgery type distribution, primary indication for re-operation, and the primary surgeon. The section uses data from all participating departments.

radius/ulna fractures
(1924)**

**Survival for primary surgery with reoperation due to any reason
except pain and discomfort from surgical hardware
radius/ulna fractures
(1917)**

**Method distribution for radius/ulna fractures
(1701)**

Femur

**Method of osteosynthesis femur fractures
(102)**

**Indication for reoperation of femur fractures
(16)**

**Primary surgeons for femur fractures
(111)**

**Level of supervision for femur fractures
(109)**

**level of supervision for interns and residents
femur fractures
(67)**

**Surgical delay for femur fractures
(95)**

(Proportion of patients operated in 24 hour intervals)

**Survival for primary surgery with reoperation due to any reason
femur fractures
(139)**

**Survival for primary surgery with reoperation due to any reason
except pain and discomfort from surgical hardware
femur fractures
(129)**

**Method distribution for femur fractures
(111)**

Tibia/fibula

**Method of osteosynthesis tibia/fibula fractures
(215)**

**Indication for reoperation of tibia/fibula fractures
(27)**

**Primary surgeons for tibia/fibula fractures
(266)**

**Level of supervision for tibia/fibula fractures
(262)**

**level of supervision for interns and residents
tibia/fibula fractures
(200)**

**Surgical delay for tibia/fibula fractures
(245)**

(Proportion of patients operated in 24 hour intervals)

**Survival for primary surgery with reoperation due to any reason
tibia/fibula fractures
(325)**

**Survival for primary surgery with reoperation due to any reason
except pain and discomfort from surgical hardware
tibia/fibula fractures
(317)**

**Method distribution for tibia/fibula fractures
(266)**

**Method of osteosynthesis hand fractures
(124)**

**Indication for reoperation of hand fractures
(4)**

**Primary surgeons for hand fractures
(158)**

**Level of supervision for hand fractures
(155)**

**level of supervision for interns and residents
hand fractures
(110)**

**Surgical delay for hand fractures
(141)**

(Proportion of patients operated in 24 hour intervals)

**Survival for primary surgery with reoperation due to any reason
hand fractures
(172)**

**Survival for primary surgery with reoperation due to any reason
except pain and discomfort from surgical hardware
hand fractures
(172)**

Foot

**Method of osteosynthesis foot fractures
(26)**

**Indication for reoperation of foot fractures
(1)**

**Primary surgeons for foot fractures
(28)**

**Level of supervision for foot fractures
(28)**

**level of supervision for interns and residents
foot fractures
(17)**

**Surgical delay for foot fractures
(25)**

(Proportion of patients operated in 24 hour intervals)

**Survival for primary surgery with reoperation due to any reason
foot fractures
(35)**

**Survival for primary surgery with reoperation due to any reason
except pain and discomfort from surgical hardware
foot fractures
(35)**

Appendix 1

	Registered parameter	Values
Patient related parameters	CPR	Unique ID
	Gender	Male / Female
	Age	Years
	ASA score*	1/2/3/4
Trauma related parameters	Operated side	Left / Right
	Date and Time of the radiological exam**	Time of the day and date
	Major Trauma ***	Yes / No
	Gustillo Type	Closed / 1 / 2 / 3a / 3b / 3c
	Neurovascular status	Unimpaired/ dysthesia /parasthesia / lack of pulse
	Pathologic fracture****	Yes / No
Surgery related parameters	Date and Time of surgery	Time of the day and date
	Procedure Type	Primary / secondary / planned*****
	Fracture Type	Adult / pediatric / periprosthetic
	Fracture Diagnosis	AO Müller / Rorabeck / Vancouver classification
	Method of osteosynthesis	Locking plate, non-locking plate, screw (one or more), K-wire, steel wire, cable, threaded wire, intramedullary nail, elastic nail, external fixation (bars), external fixation (ring), hemi arthroplasty , total arthroplasty, sliding hip screw, intramedullary nail with sliding screw (short), intramedullary nail with sliding screw (long), Hook plate, removal of hardware, fracture reduction w/o osteosynthesis, Hook pins, Polyfix, arthroplasty reduction, locking attachment plate, syndesmotic screw(s), ASLS screw for intramedullary, none of the above.
	Supplemental surgical procedures	Arthrodesis, bone resection, osteotomy, bone suture, Bone transplant (autograft), Bone transplant (allograft), Bone transplant (substitute), Amputation, fasciotomy , soft-tissue debridement, brisement, hematoma evacuation, tendon surgery, nerve or vascular surgery, ligament surgery, none of the above, reaming, nerve decompression , secondary suture, meniscal / labral suture, meniscal / labral resection, prosthesis exchange, VAC therapy, skin transplant, joint reduction, arthroscopic assistance.
	Antibiotic prophylaxis	Yes / No
	Use of tourniquet	Yes / No
	Educational level of the surgeon	Intern, 1 st year resident, 2 nd year resident, 3 rd year resident, 4-5 th year resident, attending, traumatologist*****
	Educational level of the supervisor if present	Intern, 1 st year resident, 2 nd year resident, 3 rd year resident, 4-5 th year resident, attending, traumatologist*****

* American Society of Anaesthesiologist (ASA) score

** Date and time of the radiological examination that provided indication for surgery

*** Major trauma was defined as when a trauma team was assembled upon arrival of the patient to the hospital

**** Pathologic fracture as suspected on radiological exam

***** A primary surgical procedure is defined as the first surgical procedure due to a fracture. A planned secondary procedure is defined as a surgical procedure that is a part of the primary treatment plan following primary surgery. A reoperation is defined as a surgical procedure that is not a part of an initial treatment plan following primary surgery

***** Traumatologist: attending in orthopaedic surgery with at least 2 years of trauma subspecialization.

Indications for reoperation:
Infection
Muscle- and soft-tissue revision
Neurovascular complication
New fracture
Not identified intraoperative fracture
Suboptimal osteosynthesis
Secondary fracture dislocation or osteosynthesis failure
Pseudoarthrosis
Bone necrosis
Pain or discomfort from osteosynthesis

Indications for reoperation that are registered by the surgeon in DFDB when reoperation is registered.

The report is published in collaboration with the
Department of Orthopaedic Surgery, Hvidovre Hospital
